Gold Market Review & Outlook

After a record-breaking start to the year, June was gold's most difficult month of 2026. But it is worth being clear from the outset about what kind of setback this was. Gold did not fall because its long-term case weakened; it fell because a war premium unwound, the Federal Reserve turned firmer, and investors took profits after an extraordinary run. This was a correction in price, not in purpose – and the two are easy to confuse in a month like this one.

1. Gold Market Review

Gold came into the year on a powerful run, setting fresh records in January before gradually giving ground through the spring. In June that drift became a decline. Prices fell steadily through the month and briefly slipped below a level not seen since last year, before steadying into month-end. India moved in step with the global market, and the Choice Gold ETF tracked the domestic price closely throughout. For all the drama, gold still sits among the better-performing assets of the past year – a reminder that a sharp month and a weak year are not the same thing.

For an Indian investor, though, the headline dollar number tells only half the story – and the less important half. What a domestic investor actually earns depends on gold measured in rupees, not dollars, and over the first half of the year those two paths diverged sharply. Measured in US dollars, gold ended the half roughly where it began, a shade lower. Measured in rupees, the same metal delivered a clearly positive return. The difference is the currency: as the rupee weakened against the dollar, each ounce of gold converted into more rupees, quietly turning a flat market abroad into a gain at home. This is not a quirk of one month; it is one of the central reasons gold has earned its place in Indian portfolios for decades.

It is worth dwelling on why this matters. This is not a quirk of one half-year. Step back two decades and the same force is unmistakable: gold has compounded handsomely in dollars over that time, but in rupees it has compounded faster still, and the steady gap between the two lines is almost entirely the rupee's long, gradual decline against the dollar. For a rupee-based saver, that currency drift has been a persistent tailwind on top of whatever gold did in dollar terms.

Twenty years, one metal: gold in USD vs INR (2005=100)

Chart 3: Twenty years, one metal – gold in US dollars versus Indian rupees, indexed to 2005. Source: WGC/LBMA (USD and INR); Choice AMC.

It helps to separate the two ingredients of that return. Part comes from the global gold price, set in dollars and shared by investors everywhere. The rest comes from the currency – the rupee buying fewer dollars each year, so that the same dollar-priced ounce is worth progressively more at home. Over the last ten and twenty years alike, that currency contribution has added a meaningful few points a year to the domestic return, turning a strong dollar performance into an even stronger rupee one.

The deeper point is why this recurs. The rupee tends to soften in exactly the conditions that unsettle Indian investors elsewhere in their portfolios – global risk aversion, higher oil prices, pressure on the current account. Gold's habit of holding or gaining value in rupee terms during those moments is precisely what makes it such an effective diversifier for a domestic investor. It is not that gold is uniquely Indian; it is that, for someone who spends in rupees, gold quietly does two useful jobs at once – a store of value in the global sense, and a hedge against the slow erosion of the currency they earn and save in.

2. Key Drivers

2.1 Inflation, Real Yields, and Gold

In plain terms: real rates are simply interest rates after subtracting inflation – what an investor actually earns above rising prices. When they climb, gold, which pays no income, becomes costlier to hold.

June's fall was, at heart, about real rates. Inflation stayed firm, but the more important change was in expectations for the Fed: markets moved from anticipating rate cuts to bracing for a possible increase. That shift lifted the return available on cash and bonds, and made a non-yielding asset like gold less compelling in the near term. It is a familiar pattern – gold tends to struggle when a central bank is seen as firmly in control of inflation – and the table below places today's conditions alongside the historical regimes that shaped gold in the past.

Inflation Regime	Real Rates / Policy	US Dollar	Gold	Historical Echo
High inflation, central bank behind the curve	Low / negative real rates	Weakens	Rises strongly	1970s stagflation
High inflation, central bank aggressive	Sharply positive real rates	Strengthens	Falls / consolidates	Early 1980s (Volcker) – and, milder, mid-2026
Low / moderate inflation, low rates	Low real rates	Soft / neutral	Supported, range-trades	2010s
Disinflation / active tightening	Rising real rates	Firmer	Lags	2013 taper; late-2010s
Deflation / financial crisis	Falls, but haven bid dominates	Mixed	Rises as a haven	2008 GFC
High inflation + de-dollarization (2022 →)	Real rates positive, yet...	Reserve share falling	Rises despite positive real yields	2022–2026

The deeper point is the one the table's final row makes: since 2022, gold has often risen even when real rates were high, because a new and patient buyer – the world's central banks – has changed the market's centre of gravity. That structural bid is why June's correction, though sharp, stayed orderly.

2.2 The Federal Reserve

Unlike May, June brought a live policy meeting and a genuine change of tone. The Fed, now under new leadership, leaned firmer and signalled greater resolve on inflation. For gold this cut two ways. A more credible, inflation-focused Fed is a near-term headwind, because it lifts real rates. Yet the earlier bout of anxiety about the Fed's independence – which unsettled markets at the start of the year – is exactly the kind of worry that draws investors toward gold as a monetary hedge. Confidence restored is a headwind; confidence questioned is a tailwind.

2.3 Geopolitics

June's clearest lesson was a counterintuitive one. The conflict between the US and Iran eased – and gold fell rather than rose. More surprising still, gold had underperformed during the conflict itself, defying its usual role as a safe haven. The explanation is that this particular shock was also inflationary, through oil, and arrived when investor positioning and a firmer dollar were already working against gold. The lesson is not that gold has lost its haven quality, but that any single episode is a poor guide to it. Geopolitical risk remains a genuine support for gold over time, even when one conflict breaks the pattern.

2.4 The Official Sector – The Bid Beneath the Market

While the price fell, the foundation beneath it grew stronger. Central banks kept buying through the period, led once again by a familiar group of emerging economies, and their own surveys point to the strongest intentions to keep accumulating gold on record. This is the quiet, structural story that has underpinned gold for four years: a large, price-insensitive buyer that keeps returning regardless of the monthly swings. It is the single most important reason a correction like June's tends to find a floor.

The reserves baton – by the numbers

- Gold is now roughly a quarter of global reserves – up from about a tenth a decade ago
- The dollar's share has fallen from around three-fifths to the low-forties
- Central banks have bought on the order of 1,000 tonnes a year since 2022
- A record share of central banks intend to add still more – on the latest official survey

The same story shows up in the longer-run reserve data: gold has been slowly winning back share from the dollar in global reserves, a reversal of the trend of the 1990s and 2000s, with emerging-market central banks doing the buying. It is the single most durable support beneath the gold price.

3. India in Focus

For Indian investors, June was still shaped by May's steep rise in the import duty. The effect has been to make imported gold more expensive at home and to soften demand – the outcome the policy intended, as the government worked to ease pressure on the rupee and the current account. Yet the structural case is, if anything, sharpened by this. India remains the world's second-largest gold market, and – as the first half made plain – the very currency weakness that prompted the duty is what lifted gold's rupee return above its dollar return. The near-term cost of ownership has risen; the long-term reason to own it has not.

A note on terms: the “landed price” is simply the international price plus duty and other costs – what imported gold effectively costs in India. When domestic prices trade below it, that gap is the “discount.”

4. Outlook

Near term, gold's path rests on three questions: whether the Fed follows through on a firmer stance, whether the current geopolitical calm holds, and how resilient Asian and Indian demand proves. With the war premium discharged and the Fed leaning firmer, a period of consolidation would be no surprise – and, in our view, no cause for concern.

We offer no price target. What we would emphasise instead is that June corrected the price of gold without damaging the case for it. The forces that matter most over the long run – steady central-bank buying, the gradual move away from the dollar, and the deepening of investment demand across Asia – are undisturbed. Independent analysis, including the World Gold Council's mid-year work, points the same way: that this structural support should cushion the downside, while a fresh shock or a change in the interest-rate outlook could just as easily reignite the advance.

For Indian investors, the conclusion is a steadying one. The duty raises the near-term cost of holding physical gold, but gold's core roles – as a diversifier against equity risk and a hedge against a weaker rupee – are reinforced, not weakened, by the current environment. The Choice Gold ETF remains a simple, liquid, cost-efficient way to hold that strategic allocation.

CIO COMMENTARY

June represented gold's most challenging month of the year, but does not alter our medium-term assessment. Prices declined as the geopolitical risk premium receded and the Federal Reserve, under new leadership, adopted a more restrictive tone. These developments pushed real interest rates higher and increased the opportunity cost of holding a non-yielding asset. It is also important to view the move in context: gold had reached record highs only a few months earlier, and part of June's decline reflected a period of consolidation after a strong advance.

The underlying structural drivers remain intact. Central banks continue to add to gold reserves, the global reserve system is gradually diversifying away from the US dollar, and India's core demand remains resilient despite the near-term impact of higher import duties. Those duties are themselves a policy response to the currency pressures that gold is intended to hedge. We therefore remain constructive on gold over the medium term and regard June's correction as part of a normal market cycle, rather than a challenge to the strategic investment case. The Federal Reserve's policy path remains the principal factor to monitor.

Equity Market Outlook

June closed a strong first quarter of the new fiscal year on a firmer footing, but the month's real story was breadth rather than headline strength. The Nifty-50 added 1.4% and the Sensex 2.3%, yet the broader market did the heavier lifting – the Smallcap 250 rose 4.3% and the Nifty 500 gained 1.5%. Stepping back over April–June, the picture is emphatic: the Nifty-50 returned 6.9% for the quarter while the mid- and small-cap segments compounded at 17–24%. This note reads the month against that quarterly backdrop and sets out how we are positioned entering the second quarter.

1. Market Performance

June extended the recovery that has run through Q1 FY27, and the defining feature remained the width of participation. Against the Nifty-50's 6.9% quarterly gain, the Nifty 500 returned 12.0%, the Midcap 150 17.2% and the Smallcap 250 24.0% – a dispersion that tells you the market's engine over the quarter sat below the large cap index, not within it. The calendar-year-to-date figures stay negative for the large caps because they still carry the January–March drawdown; the fiscal-quarter numbers capture only the recovery leg, and there the strength is unambiguous.

Indian equity index returns (%)

Market	Jun-26 (MoM)	Q1 FY27	CY26 YTD
Nifty 50	1.4	6.9	-8.7
Nifty Next 50	0.8	18.7	3.3
Nifty 500	1.5	12.0	-3.7
Nifty Midcap 150	0.9	17.2	2.2
Nifty Smallcap 250	4.3	24.0	6.2
BSE Sensex	2.3	6.3	-10.3

Source: Choice AMC Internal Research. MoM = Jun-26 over May-26; Q1 FY27 from 31-Mar-2026 close; CY26 YTD from 31-Dec-2025 close.

Globally, India continued to trail the AI-led markets – the Nifty was among the weaker large indices in USD terms over the month and remains the notable negative-CY26 outlier while Korea and Taiwan led. We read this divergence as a matter of sector composition, not domestic weakness: India simply does not carry the semiconductor and AI-hardware weight that has driven the leaders, and that gap should not be mistaken for a fundamental problem at home.

2. Sector and Macro Drivers

Leadership through June and across the quarter rotated decisively toward domestic-facing, rate-sensitive and asset-heavy themes, while the export-oriented IT pack stayed the clear laggard. Over the quarter Realty, Media, the banking complex and Energy led; IT fell a further 9.5% as global technology-spend concerns persisted. Within June itself the rotation was visible in the monthly column – the banking complex and consumer-facing names gained, while Metals and IT gave background after a strong run.

Sectoral index performance (%)

Sector (Nifty)	Jun-26 (MoM)	Q1 FY27	12-month
Realty	6.0	27.4	-15.9
Media	5.0	17.2	-15.7
Private Bank	6.1	15.7	-1.2
Bank	6.1	14.5	0.4
Energy	-2.8	14.0	8.7
Pharma / Healthcare	4.0	13.9	14.9
Metal	-6.9	12.4	31.3
Auto	0.5	11.4	10.9
PSU Bank	4.1	7.9	17.9
FMCG	-1.2	7.1	-11.1
Oil & Gas	-1.5	2.2	-6.5
IT	-9.6	-9.5	-32.5

Source: Choice AMC Internal Research. MoM = Jun-26 over May-26; Q1 FY27 from 31-Mar-2026 close; 12-month over 30-Jun-2025.

The macro backdrop was mixed but broadly supportive of the domestic-facing tilt. Wholesale price inflation stayed elevated on fuel, keeping a WPI-CPI divergence in view and a watch on input-cost pressure for margins; crude and the rupee remain the two swing variables we monitor most closely for FY27 corporate profitability. Against that, the domestic growth and rate environment continues to favour the banks, real estate and consumption-linked plays that led the quarter.

3. Flow Architecture

The flow story remains the single most important structural support under this market. Foreign investors stayed net sellers – FIIs sold roughly ₹32,963 crore of Indian equities in June, extending the heavy foreign outflow that has characterised FY26. Yet the market absorbed that selling and still rose, because the domestic institutional bid has become the marginal price-setter. Domestic institutions have now bought through a positive streak running beyond thirty consecutive months, funded by the steady, rule-based SIP flows that reach the market every month regardless of sentiment. That handover – from foreign flows as the swing factor to domestic flows as the anchor – is the de-risking story of this cycle, and June was another clean demonstration of it.

Q1 FY27 institutional equity flows (US\$ bn)

Category	May-26	CY26YTD (Jan–May)	Net Flows Q1 FY27	DII Cover of FII selling
Apr-26	-5.20	5.50	0.30	1.1x
May-26	-4.90	8.70	3.80	1.8x
Jun-26	-2.90	9.00	6.10	3.1x
Q1 FY27	-13.00	23.2	10.20	1.8x

Source: Choice AMC Internal Research. DII from NSDL equity flows converted at average monthly USD/INR (Apr 93.4, May 95.4, Jun 95.0); FII net, deck basis. June FII cash segment -₹32,963 cr. “DII cover” = DII inflow ÷ FII outflow.

4. Corporate Earnings

The Q4 FY26 season delivered a headline beat with a soft core. Aggregate profit growth for the broad universe came in near 16%, but the Nifty-50’s own PAT growth was a more modest 4% – the strength sat in Metals and selected cyclicals rather than in the index heavyweights. Looking ahead, we frame FY27 Nifty EPS growth at roughly 15–16%, trimmed from the ~18% carried earlier as the Street converged lower through the results season. The read-through is clear: earnings are growing, but the pace is moderating and the quality of the beat matters. Stock and sector selection, not index-level beta, will do the work from here.

5. Valuations

Valuations tell a genuinely two-sided story, and this is where discipline earns its keep. The Nifty-50 trades at about 18.6x forward earnings – close to 11% below its ten-year average – so the largecap index is, if anything, modestly inexpensive against its own history. The earnings-yield-to-bond-yield signal is supportive on the same reading. The mid- and small-cap segments are the other side of the coin: after 17–24% quarterly gains they sit at elevated-to-stretched multiples, and at the sector level roughly two-thirds of pockets now trade at a premium to their long-run averages. The message is not to leave the market; it is to be deliberate about where the money sits.

Valuation, flow & earnings snapshot

Measure	Reading	Context
Nifty-50 forward P/E	18.6x	≈11% below 10-yr average
Earnings yield ÷ bond yield (fwd)	0.77	Supportive vs long-run band
FII net flow – June	-₹32,963 cr	Foreign investors net sellers
DII flows	Positive	30-month-plus buying streak
Q4 FY26 PAT – broad universe	+16%	Nifty-50 PAT +4% (soft core)
FY27 Nifty EPS growth (est.)	~15–16%	Trimmed from ~18%

Source: Choice AMC Internal Research. Valuation and flow readings as at 30-Jun-2026 basis; forward multiples on one-year-forward consensus earnings.

6. Outlook for Investors

Our positioning follows directly from the numbers. First, anchor in largecap quality: the Nifty-50 sits below its historical multiple with earnings still compounding, and it is the most reasonably priced part of the market today. Second, use the mid- and small-cap segments for selective growth optionality rather than broad exposure – the quarter's returns have already re-rated much of the space, so entry discipline matters more now than it did three months ago. Third, stay the course through SIPs: the domestic flow architecture that steadied this market is built on exactly this behaviour, and it is the most reliable edge a long-term investor holds. Where the largecaps trade below average and history says sub-19x forward multiples have tended to reward the patient, the case for staying invested – with discipline on where – is strong.

7. Conclusion

Q1 FY27 was a broad, healthy recovery in which the domestic bid did the heavy lifting and the market shrugged off sustained foreign selling. We enter the second quarter constructively but selectively: largecaps offer valuation comfort, earnings are growing if moderating, and the flow structure is the sturdiest it has been in this cycle. The watch-points – crude, the rupee and the pace of the earnings recovery – are known and manageable. Our conviction sits with quality, discipline and staying invested through the cycle.

CIO COMMENTARY

The quarter just closed reinforced a conviction we have held through this cycle: markets are best judged by their foundations, not their headlines. India rose through Q1 FY27 while foreign investors sold and global leadership sat elsewhere – a market that can do that is a market resting on real domestic support. The task now is not to chase the mid- and small-cap segment that has already run, but to hold quality where it is reasonably priced, add selectively, and let the SIP discipline that steadied this market keep working. We remain constructive for the twelve to eighteen months ahead, with our weight behind large cap quality and patience.

How to Read a Mutual Fund Factsheet

Alpha: Alpha is the measurement of an investment portfolio's performance against a certain benchmark – usually a stock market index.

Application Amount for Fresh Subscription: This is the minimum investment amount for a new investor in a mutual fund scheme.

AUM: AUM or Assets Under Management refers to the recent/updated cumulative market value of investments managed by a mutual fund or any investment firm.

Average portfolio price to book ratio (Average P/BV): It is price to book value of the stocks calculated for the entire portfolio on a weighted average basis.

Average portfolio PE (Average P/E): P/E is the price to earnings ratio of the fund. A high PE ratio means investors are willing to pay more for each unit of earnings of the particular stock and are expecting higher growth in the future. Average P/E is calculated using weighted average method.

Average portfolio dividend yield (Average Dividend Yield): Dividend yield is the dividend paid per unit divided by the market price of the share. Average dividend yield is calculated using weighted average method.

Benchmark: A group of securities, usually a market index, whose performance is used as a standard or benchmark to measure investment performance of mutual funds. Some typical benchmarks include the Nifty, Sensex, BSE200, BSE500, 10-Year G-Sec.

Beta Ratio (Portfolio Beta): Beta is a measure of an investment's volatility vis-à-vis the market. In case of beta, value 1 suggests that a specific fund responds to market volatility equivalently, i.e. the shift in its price is equivalent to the benchmark movements. A value above 1 represents that a specific fund demonstrates a more significant shift in its price compared to benchmark movement. A value below 1 represents the opposite.

CAGR: CAGR stands for Compound Annual Growth Rate. Essentially, CAGR is the measure of an asset or investment's annual growth rate over a set period of time, while assuming compound growth.

Entry Load: Not applicable in accordance with the requirements specified by the SEBI circular no. SEBI/IMD/CIR No.4/168230/09 dated June 30, 2009. No entry load will be charged for purchase/additional purchase/switch-in accepted by NIMF with effect from August 01, 2009. Similarly, no entry load will be charged with respect to registrations for registrations under Systematic Investment Plans/Systematic Transfer Plans accepted by NIMF with effect from August 01, 2009. With reference to SEBI circular no. SEBI/HO/IMD/DF2/CIR/P/2019/42 dated March 25, 2019, there shall be no upfront load for investments under SIPs registered before August 01, 2009 with effect from April 15, 2019. The upfront commission on investment made by the investor, if any, will be paid to the ARN Holder (AMFI registered Distributor) directly by the investor, based on the investor's assessment of various factors including service rendered by the ARN Holder.

Exit Load: Exit load is a charge which is charged at the time an investor redeems the units of a mutual fund. The exit load is deducted from the prevailing NAV at the time of redemption (or exit).

For instance, if the NAV is Rs.100 and the exit load is 1%, the redemption price would be Rs.99 per unit.

Holdings: The holdings of the portfolio is a mutual fund's latest or updated reported statement of investments/securities. These are usually displayed in terms of percentage to net assets or the rupee value or both. The objective is to give investors an idea of where their money is being invested by the fund manager.

IDCW: Income Distribution cum Capital Withdrawal Options/Plans refers to distribution of income in a mutual fund scheme, which may include dividends paid by stocks, and capital gains made by selling underlying stocks in the portfolio.

Inflation: Inflation is a rise in price levels of goods/services that are required for day-to-day use. It primarily indicates the fall in the purchasing capacity of the rupee.

Minimum Additional Amount: This is the minimum investment amount for an existing investor in a mutual fund scheme.

Modified Duration: This is a formula that expresses the measurable change in the value of a security in response to a change in interest rates. Modified duration follows the concept that interest rates and bond prices move in opposite directions.

Nature of Scheme: The investment objective and underlying investments determine the nature of the mutual fund scheme. For instance, a mutual fund that aims at generating capital appreciation by investing in stock markets is an equity fund or growth fund. Likewise, a mutual fund that aims at capital preservation by investing in debt markets is a debt fund or income fund.

Each of these categories may have subcategories.

NAV: The NAV or the net asset value is the total asset value per unit of the mutual fund after deducting all related and permissible expenses. The NAV is calculated at the end of every business day. It is the value at which the investor enters or exits the mutual fund.

$$NAV = (\text{Assets} - \text{Liabilities}) / \text{Total number of outstanding shares.}$$

Net Equity: Net equity level is the net equity exposure percentage adjusted for any derivative positions in stocks or index for hedging or rebalancing purpose.

Portfolio Turnover Ratio: The portfolio turnover ratio is the rate at which assets in a fund are bought and sold by the portfolio managers. In other words, the portfolio turnover ratio refers to the percentage change of the assets in a fund over a one-year period.

R Squared (R²): It is a statistical measure of how closely the portfolio returns are correlated with its benchmark. So, if the R² of a model is 0.50, then approximately half of the observed variation can be explained by the model's inputs.

Rating Profile: Mutual funds invest in securities after evaluating their creditworthiness as disclosed by the ratings. A depiction of the mutual fund in various investments based on their ratings becomes the rating profile of the fund. Typically, this is a feature of debt funds.

Riskometer: Riskometer is a graphical representation of the risk a mutual fund carries. The graph is designed as per the Association of Mutual Funds in India (AMFI) guidelines. It displays 5 levels of risk, with low representing the lowest risk on the diagram and very high the highest.

Rolling Returns: Rolling returns are the annualized returns of the scheme taken for a specified period (rolling returns period) on every day/week/month and taken till the last day of the duration.

Sharpe Ratio: The Sharpe Ratio, named after its founder, the Nobel Laureate William Sharpe, is a measure of risk-adjusted returns. It is calculated using standard deviation and excess return to determine reward per unit of risk. The greater a portfolio's Sharpe ratio, the better its risk-adjusted performance. A negative Sharpe ratio means the risk-free or benchmark rate is greater than the portfolio's historical or projected return, or else the portfolio's return is expected to be negative.

SIP: SIP or systematic investment plan works on the principle of making periodic investments of fixed sum. It works similar to recurring bank deposit. For instance, an investor may opt for an SIP that invests Rs.500 every 15th of the month in an equity fund for a period of three years, then over the three years he would invest Rs.18,000.

Standard Deviation: Standard deviation is a statistical measure of the range of an investment's performance. When a mutual fund has a high standard deviation, it means its range of performance is wide, implying greater volatility.

Volatility: Volatility is a statistical measure of the dispersion of returns for a given security or market index. In most cases, the higher the volatility, the riskier the security.

Yield to Maturity: The Yield to Maturity or the YTM is the rate of return anticipated on a bond if held until maturity. YTM is expressed as an annual rate. The YTM factors in the bond's current market price, par value, coupon interest rate and time to maturity.
